

POWER GENERATION & TRANSMISSION

The generation and transmission of power in the United States has become an increasingly complex landscape involving a host of challenging legal, regulatory, and transactional issues. Changes to federal and state regulations and procedures have increased the difficulty for utilities, independent power producers, and merchant transmission developers to build additional generation and transmission, particularly at a time where the national electricity grid is facing unique challenges and circumstances that require additional investment to modernize our nation's power facilities. Further, the regulatory issues facing owners of generation and transmission assets continue to evolve and require constant monitoring and oversight, with an eye toward innovative and individualized solutions.

Van Ness Feldman is uniquely capable of meeting the challenges facing the utility industry, including developers and owners of generation and transmission assets. Please visit our Energy pages to learn more about the firm's capabilities in these areas.
